

## LETTER OF RECOMMENDATION

### To Whom It May Concern

I am pleased to recommend **Ivan Maznitsyn**, who contributed to **Vita - AI Health Assistant**, an integrated digital healthcare ecosystem developed within **Fund Health Care**, from **May 2, 2026 to September 15, 2026**, as a **QA Engineer and Full-Stack Developer**.

Ivan combined software quality assurance with hands-on product development. His QA responsibilities included functional, integration, API, end-to-end, and regression testing; validation of user workflows and system interactions; issue identification; and stability verification across implemented functionality.

As a Full-Stack Developer, Ivan worked across Vita's frontend and backend, including UI, APIs, databases, SQL migrations, and business logic. He contributed to integrating the **Vita Patient App** and **Clinician App** through shared Supabase infrastructure, connecting patient-clinician interactions, clinical data, prescriptions, health history, reporting, acknowledgements, and communication within a unified medical platform.

Beyond individual features, Ivan contributed to the product and system logic of the healthcare platform: patient-clinician workflows, clinical data exchange, versioned clinical changes, patient review and acknowledgement mechanisms, and information flows between patient-facing and clinician-facing applications. This required approaching the platform as an interconnected system rather than as separate applications.

Particular attention was given to **security and access control**, including appropriate separation of patient-clinician relationships and careful handling of sensitive medical data within implemented workflows.

Ivan also demonstrated a strong competency in AI-assisted development. He effectively used modern AI tools for AI-assisted rapid development across software design, implementation, analysis, debugging, and testing, combining accelerated workflows with engineering validation, automated checks, and QA-driven quality control.

He participated in iterative product refinement and cross-application integration, helping transform separate functional components into a coherent experience for both patients and clinicians.

As a result of this work, **Vita was advanced to an integrated MVP**, with the patient and clinician applications operating as interconnected components of a **unified digital healthcare ecosystem**.

Ivan demonstrated a strong combination of **QA Engineering, Full-Stack Development, AI-assisted Development, systems thinking, and product-level responsibility**. I am pleased to recommend him for roles and projects requiring software quality, full-stack engineering, systems integration, and effective application of modern AI technologies.

Sincerely,

Serge Garden  
President of AVB Invest Inc.
